

Heapsort

Relationship between Array Indexes and Tree Elements

- A complete binary tree has an interesting property that we can use to find the children and parents of any node.
- If the index of any element in the array is i
 - the element in the index $2i+1$ will become the left child
 - the element in the index $2i+2$ will become the right child
- Also, the parent of any element at index i is given by the lower bound of $(i-1)/2$.

0	1	2	3	4	5
1	12	9	5	6	10

Heap Data Structure

- Heap is a special tree-based data structure
- A binary tree is said to follow a heap data structure if
 - it is a complete binary tree
 - All nodes in the tree follow the property that
 - They are greater than their children : Max-Heap
 - Or all nodes are smaller than their children : Min-Heap

What is Heapify

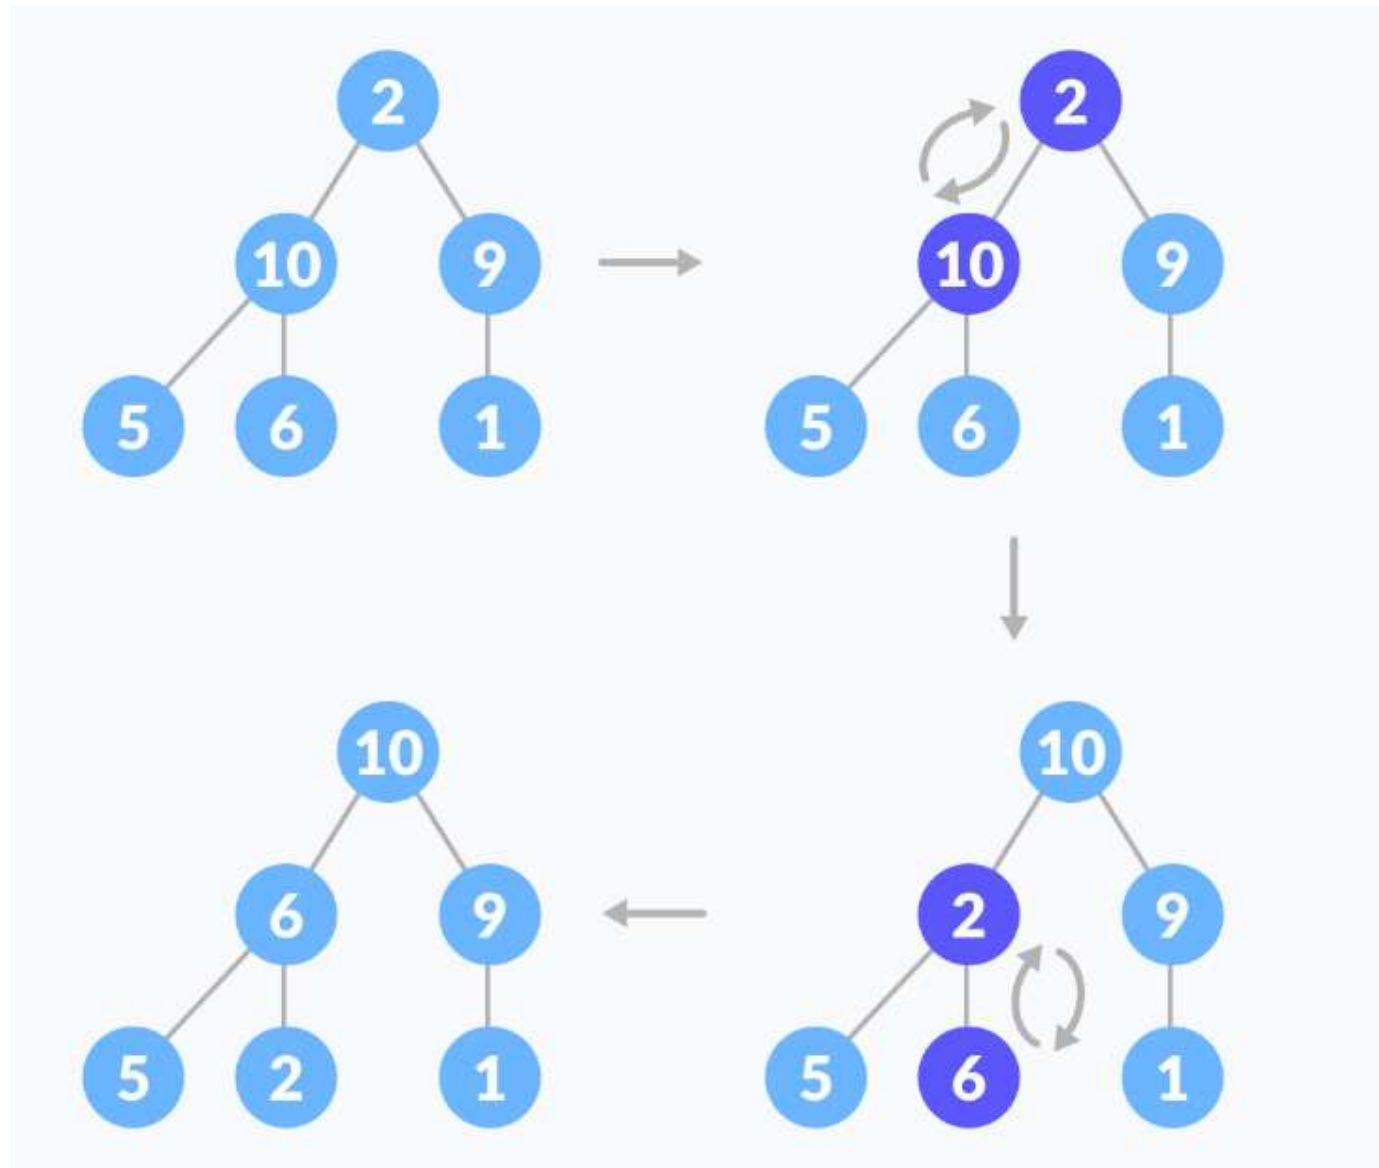

- Heapify is the process of creating a heap data structure from a binary tree.

Scenario-1

Scenario-2

Max-Heapify Operation

Algorithm 1: Max-Heapify Pseudocode

Data: B : input array; s : an index of the node

Result: Heap tree that obeys max-heap property

Procedure Max-Heapify(B, s)

$left = 2s$;

$right = 2s + 1$;

if $left \leq B.length$ and $B[left] > B[s]$ **then**

$largest = left$;

else

$largest = s$;

end

if $right \leq B.length$ and $B[right] > B[largest]$ **then**

$largest = right$;

end

if $largest \neq s$ **then**

$swap(B[s], B[largest])$;

 Max-Heapify($B, largest$);

end

end

Building **max-heap**

- To build a max-heap from any tree, we can thus start heapifying each sub-tree from the bottom up and end up to the root element.
- Start our algorithm with a node that is at the lowest level of the tree and has children node $(n/2 - 1)$
- Continue this process and make sure all the subtrees are following the max-heap property

```
// Build heap (rearrange array)
for (int i = n / 2 - 1; i >= 0; i--)
    heapify(arr, n, i);
```

Example

arr

0	1	2	3	4	5
1	12	9	5	6	10

n = 6

i = $6/2 - 1 = 2$ # loop runs from 2 to 0

i = 2 \rightarrow heapify(arr, 6, 2)

i = 1 \rightarrow heapify(arr, 6, 1)

$i = 0 \rightarrow \text{heapify}(\text{arr}, 6, 0)$

Heap Sort

Since the tree satisfies Max-Heap property, then the largest item is stored at the root node.

Swap: the root element and the last array element

Remove: Reduce the size of the heap by 1.

Heapify: Heapify the root element again so that we have the highest element at root.

swap

heapify

swap

remove
→

0	1	2	3	4	5
1	6	9	5	10	12

0	1	2	3	4	5
1	6	9	5	10	12

↓ heapify

← swap

0	1	2	3	4	5
5	6	1	9	10	12

0	1	2	3	4	5
9	6	1	5	10	12

heapify

swap

remove

↓ heapify

swap

0	1	2	3	4	5
5	1	6	9	10	12

0	1	2	3	4	5
1	5	6	9	10	12

↓ remove

0	1	2	3	4	5
1	5	6	9	10	12

0	1	2	3	4	5
1	5	6	9	10	12

```
// Heap sort
for (int i = n - 1; i >= 0; i--) {
    swap(&arr[0], &arr[i]);

    // Heapify root element to get highest element at root again
    heapify(arr, i, 0);
}
```

Heap Sort Complexity

Time Complexity	
Best	$O(n \log n)$
Worst	$O(n \log n)$
Average	$O(n \log n)$
Space Complexity	
	$O(1)$
